Regular Expressions: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved $\ensuremath{\text{@}}$ 2019

Syntax

• To start using regex, use the re module.

WILDCARDS

• To indicate that *any* character can be put in its place:

```
strings = ["bat", "robotics", "megabyte"]
regex = "b.t"
```

BEGINNINGS AND ENDINGS OF STRINGS

- To match all strings that start with "a", use "^a".
- To match all strings that end with "a", use "a\$".

COUNTING MATCHES WITHIN THE DATASET

- To check whether "needle" is a match for "haystack".
 - Input:

```
if re.search("needle", "haystack") is not None:
    print("We found it!")
else:
    print("Not a match")
```

• Output:

Not a match

MATCHING MULTIPLE CHARACTERS

• To match multiple characters, specify the characters between "[]":

```
"[bcr]at"
```

• This expression would match "bat", "cat", and "rat".

ESCAPING SPECIAL CHARACTERS

• To escape a character use "\":

```
for row in posts:
    if re.search("\[Serious\]", row[0]) is not None:
        serious_count += 1
```

COMBINING REGEX CHARACTERS

• Checking if our code has either "[Serious]" or "[serious]":

```
serious_count = 0
for row in posts:
   if re.search("\[[Ss]erious\]", row[0]) is not None:
        serious_count += 1
```

• To match either one character or another, use "|":

ADDITIONAL REGEX

• To substitute strings, use sub():

```
re.sub("yo", "hello", "yo world")
```

• To match years, use:

```
"[1-2][0-9][0-9][0-9]"
```

• To repeat characters, use "{ }". To repeat the pattern "[0-9]" four times:

```
`"[0-9]{4}"`
```

Concepts

- A **regular expression** (regex) is a sequence of characters that describes a search pattern. We can use regular expressions to search for and extract data.
- In regular expressions, escaping a character means indicating that you don't want the character to do anything special
 - The re module provides a <u>sub()</u> function that takes the following parameters (in order):
 - pattern : The regex to match
 - repl : The string that should replace the substring matches
 - **string** : The string containing the pattern we want to search
